

Speaking Words of Wisdom for Education with AI.

Education has a profound impact on individuals and societies. It empowers people, drives economic growth, and contributes to the progress of humanity across the world. We know that the more personalized we can make the educational experience for each student the more success they will have as a benefit to society.

So why are we so hesitant to leverage a tool that can have such a positive impact on education in the future.

Let's be clear of what we are defining here, the use of AI for education is not about ChatGPT writing term papers allowing students to circumvent their assignments. AI is, however, a way to revolutionize education by enhancing teaching practices and providing personalized support to students.

Artificial Intelligence comes from the analysis of data, but wisdom comes from human experiences with innate capacity to judge and evaluate allowing us to extract the most potential from any given circumstance.

If we follow the natural course of AI as a tool it is meant to be, we see that it can provide personalized learning experiences by analyzing individual student data and tailoring educational content to match each student's needs. The wisdom we can discern from this is that we can adapt to different learning styles, preferences, and abilities, that can enable teachers to better understand students' progress and identify learning gaps that then can be used to tailor instruction to the needs of the student.

So, if we let Artificial Intelligence be the tool it is meant to be then we can help students discover new topics, expand their knowledge, and pursue skills that can help them enhance their ability to become successful.

In the wise words of Sir Paul McCartney, "Speaking words of wisdom, Let It Be." Let us allow AI to fulfill its potential and then use our wisdom to create a brighter future for education.
