

The Race to AGI May Be Over. The Race for Humanity Is Just Beginning.

For decades, artificial intelligence has been moving toward a destination that once seemed almost impossible. A machine capable of reasoning, learning and solving problems across a broad range of tasks at something approaching human capability.

We gave that destination a name - Artificial General Intelligence (AGI).

Recently, Jensen Huang, CEO of NVIDIA, made a statement that should cause all of us to think about what happens next:

“AGI has arrived.”

There will undoubtedly be debate about whether today's AI truly meets the definition of AGI. But perhaps the more important point isn't whether Huang is exactly right about where we are today. It is that we are getting close enough for the conversation to change.

But imagine for a moment that Huang is right.

If we have reached the destination we have been racing toward, what happens to the race?

I believe another one begins.

And this may be the most exciting part of the story.

We could be standing at the beginning of one of the greatest periods of human possibility in history. Few technologies in history have carried the potential to create change on this scale.

But extraordinary possibilities also create extraordinary responsibility.

That responsibility doesn't belong only to the companies building AI or the governments trying to regulate it. In different ways, it belongs to all of us. To the people who build it, invest in it, deploy it, lead organizations using it and ultimately choose how it becomes part of our lives.

We have an opportunity to do more than create the most powerful technology of our generation. We have an opportunity to be intentional about what that power becomes for the generations that follow us.

At Humaital, we believe we have a responsibility to help make the most of that opportunity. This belief is at the heart of why we are building an independent way to measure AI against the six human-centered values of Trust, Purpose, Safety, Transparency, Accountability and Impact.

As machines become more intelligent, how intentional will we be about ensuring this extraordinary technology becomes one of humanity's greatest achievements?

The race to AGI may be ending.

The real race, the one that decides what this technology means for humanity, is just beginning.
